# The motivating story

## THE IKEA KITCHEN BUILDERS

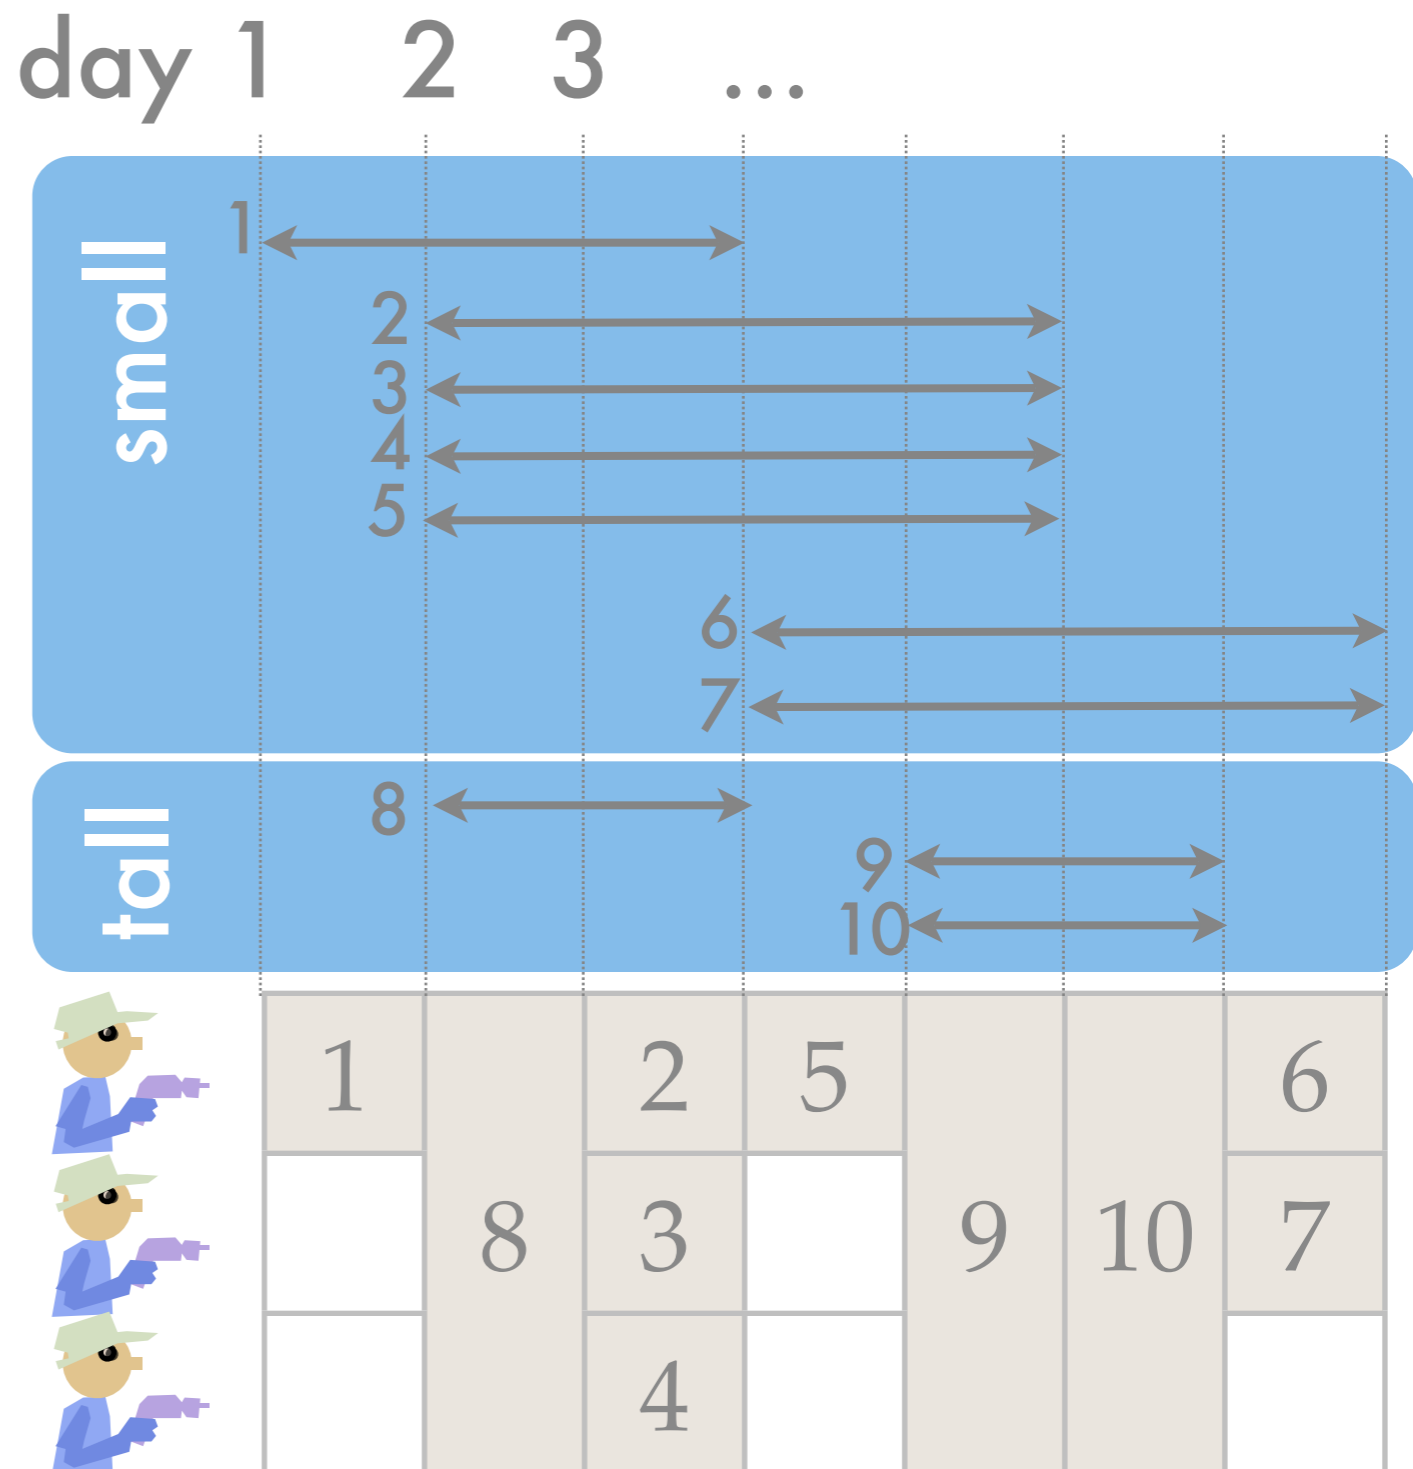

We build your kitchen in one day

Just call 0 800 222 333  
and tell us two dates between which  
you wish us to come

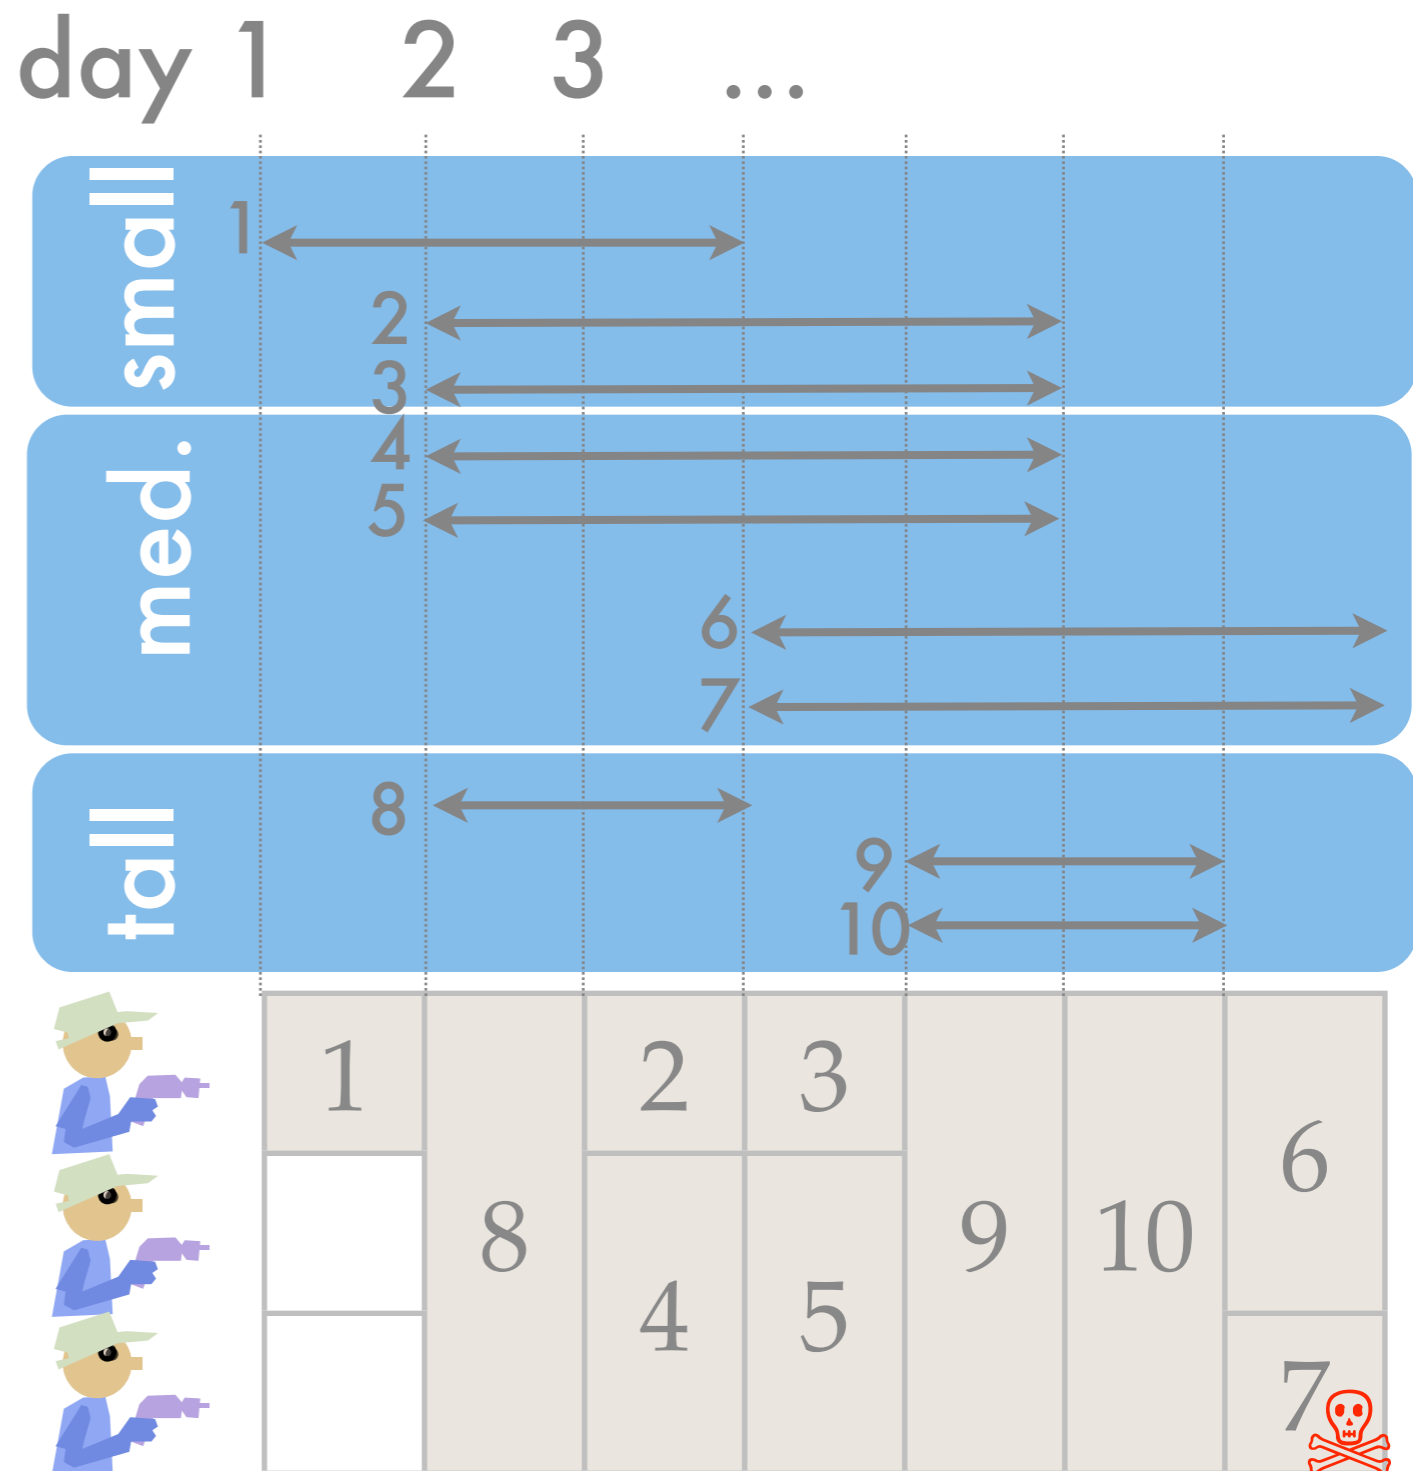

# A scheduling problem

- Orders are  $n$  jobs with release times and strict deadlines (integers)
- Processing time = 1
- We have 3 parallel machines
- However some jobs require only 1 arbitrary machine, while some require all 3 (small/tall jobs)
- Goal: find feasible schedule serving all jobs

# (Open problem)

- 3 parallel machines
- $n$  jobs with release time  $r_j$ , deadline  $d_j$ , and arbitrary size  $s_j \in \{1, 2, 3\}$
- Is it possible to find a feasible schedule in polynomial time?

# How to find a polynomial time algorithm ?

Formalize problem

solve by hand  
small instances

get intuition and understand  
the structure of the problem

design an algorithm 

model it as a integer linear  
program

show that the relaxed LP has  
always an integer solution 

simplify the LP so it becomes a  
flow problem 

# Model it as an integer LP

- First : we can assume that there are  $n$  time points (1.. $n$ ) otherwise the problem consists of independent subproblems.
- Each job  $j$  has a release time  $r_j$ , deadline  $d_j$ , size  $s_j \in \{1,3\}$
- $X_{jt}=1$  means job  $j$  schedules at time  $t$  (else  $X_{jt}=0$ )
- solve (no objective function)
  - $\forall j \forall t \quad 0 \leq X_{jt} \leq 1$
  - $\forall j \forall t \notin [r_j, d_j) \quad X_{jt}=0$  – release times, deadlines are respected
  - $\forall j \quad \sum_t X_{jt}=1$  – every job is scheduled
  - $\forall t \quad \sum_j s_j X_{jt} \leq 3$  – 3 machines are enough

# Integral solutions

- **Theorem [Baptiste,Schieber'03]** If the LP is feasible then it has an integral solution, in fact they give some objective function and show that the optimum is integral
- The LP has  $O(n^2)$  variables and  $O(n^2)$  constraints
- So the problem can be solved in expected time  $O(n^4)$  and worst case time  $O(n^{10})$

# General proof technique

- Fix some objective function, and some fractional solution  $X$
- Show that (1) either it is not optimal, or (2) it is not a vertex of the polytope
- (2:) Find two disjoint sets of **fractional** variables  $S^-$ ,  $S^+$  such that every tight constraint contains as many var. from  $S^-$  than from  $S^+$
- Then decreasing  $S^-$  by  $\epsilon$  and increasing  $S^+$  or the other way round preserves all constraints. So this is not a vertex.

|  |  |             |  |  |             |  |  |
|  |  |             |  |  |             |  |  |
|  |  | $+\epsilon$ |  |  | $-\epsilon$ |  |  |
|  |  |             |  |  |             |  |  |
|  |  | $-\epsilon$ |  |  | $+\epsilon$ |  |  |
|  |  |             |  |  |             |  |  |
|  |  |             |  |  |             |  |  |
|  |  |             |  |  |             |  |  |
|  |  |             |  |  |             |  |  |

# When does a LP has integral solution ?

- $\min c^T x, \text{ s.t. } Ax \leq b, b \text{ integral}$
- **Theorem:** all vertices of the polytope are integral if  $A$  is totally unimodular, i.e. for any  $c, b$ , the LP has an integral optimum
- **Defintion:**  $A$  is *totally unimodular* if every squared submatrix has determinant  $-1, 0,$  or  $+1$

# Total unimodularity

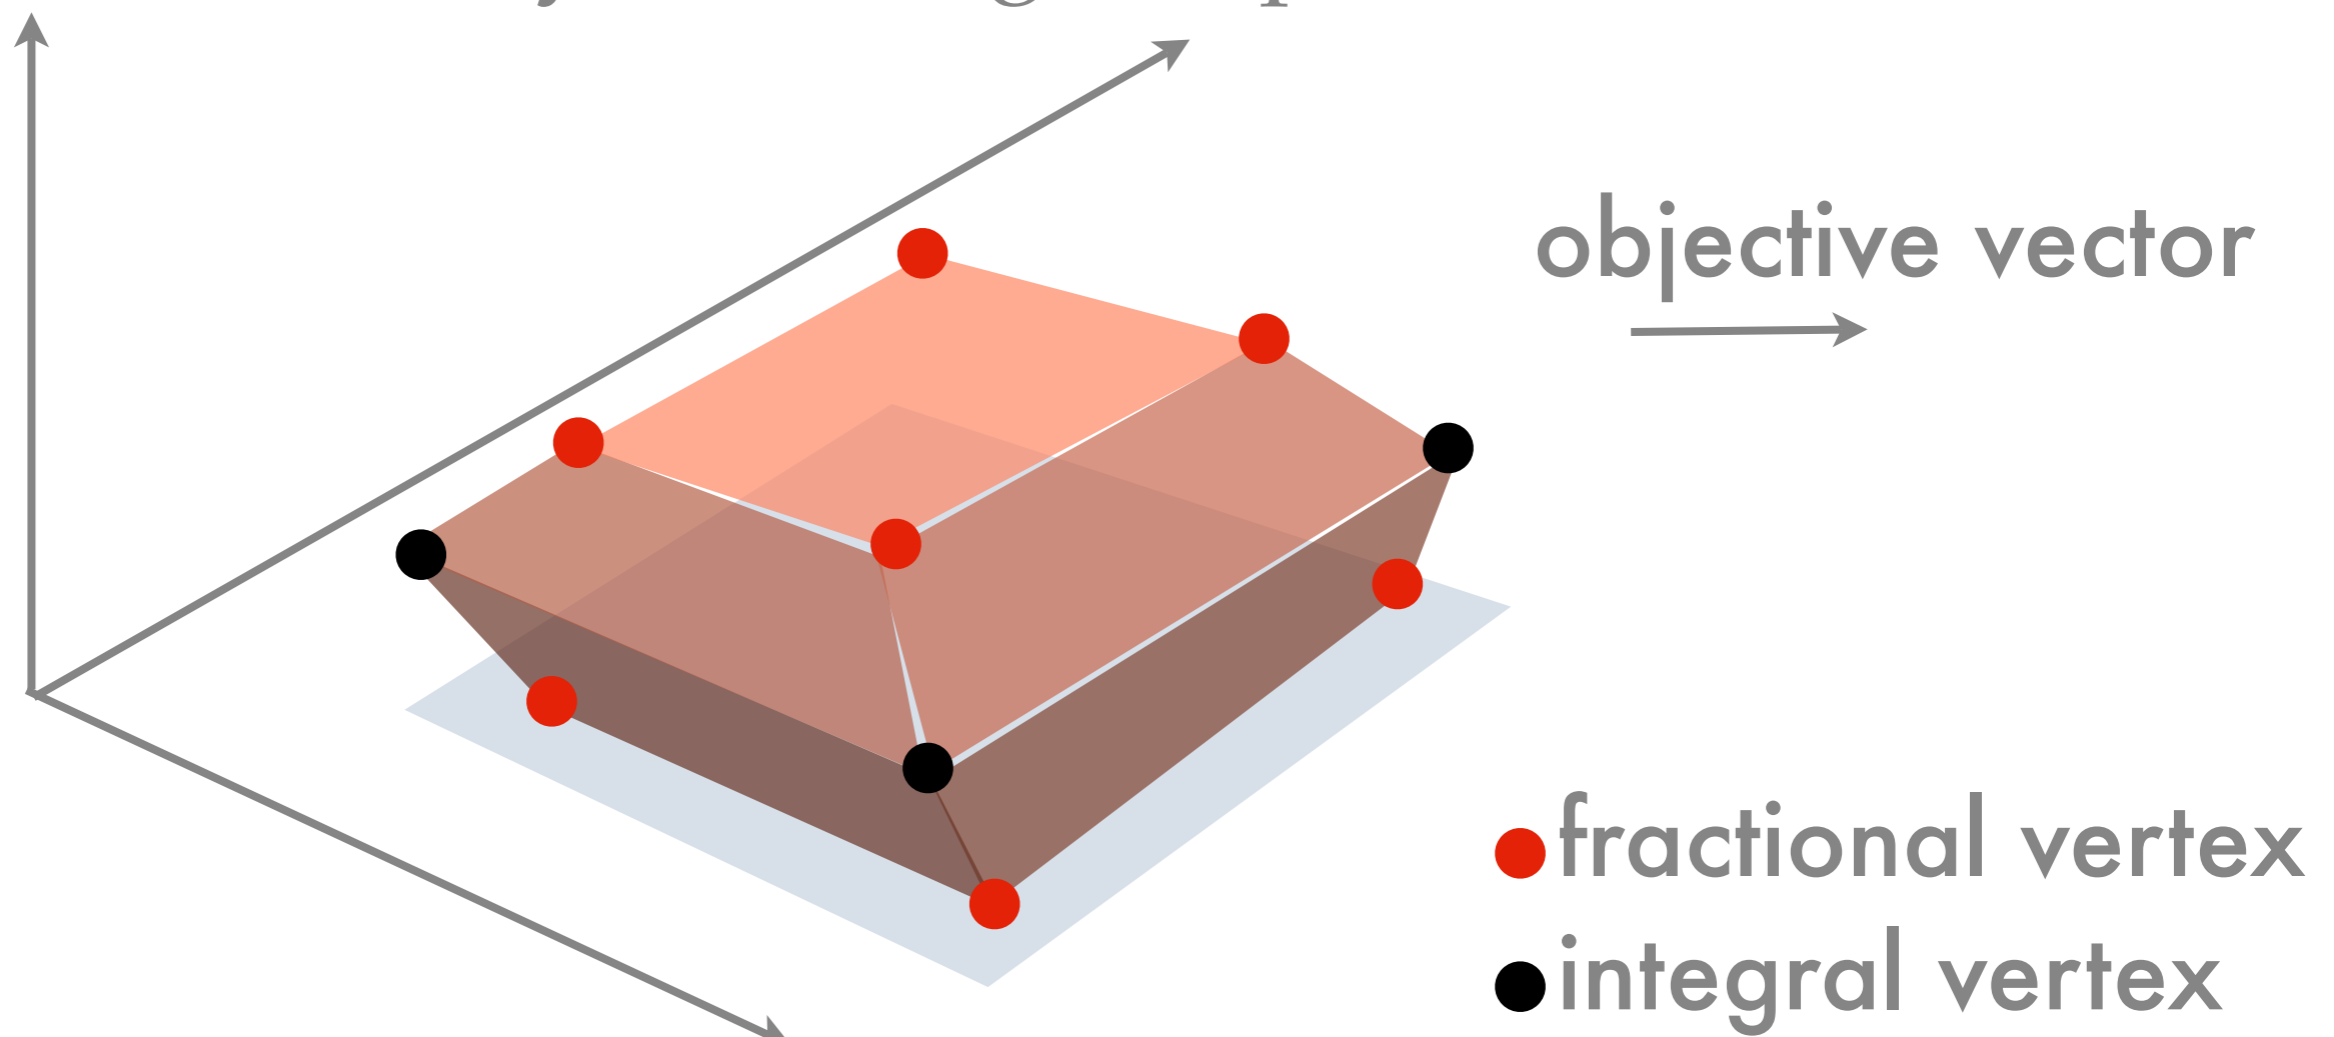

- **Thm [Poincaré'1900]** The incidence matrix of a directed graph is totally unimodular

- **Thm [Seymour'83]** The set of all totally unimodular matrices is generated by all incidence matrices, and two specific 5x5 matrices under some operations.

# Our contribution

- Baptiste and Schieber's LP is not totally unimodular (it has coefficients 3), but still has always an integral optimum

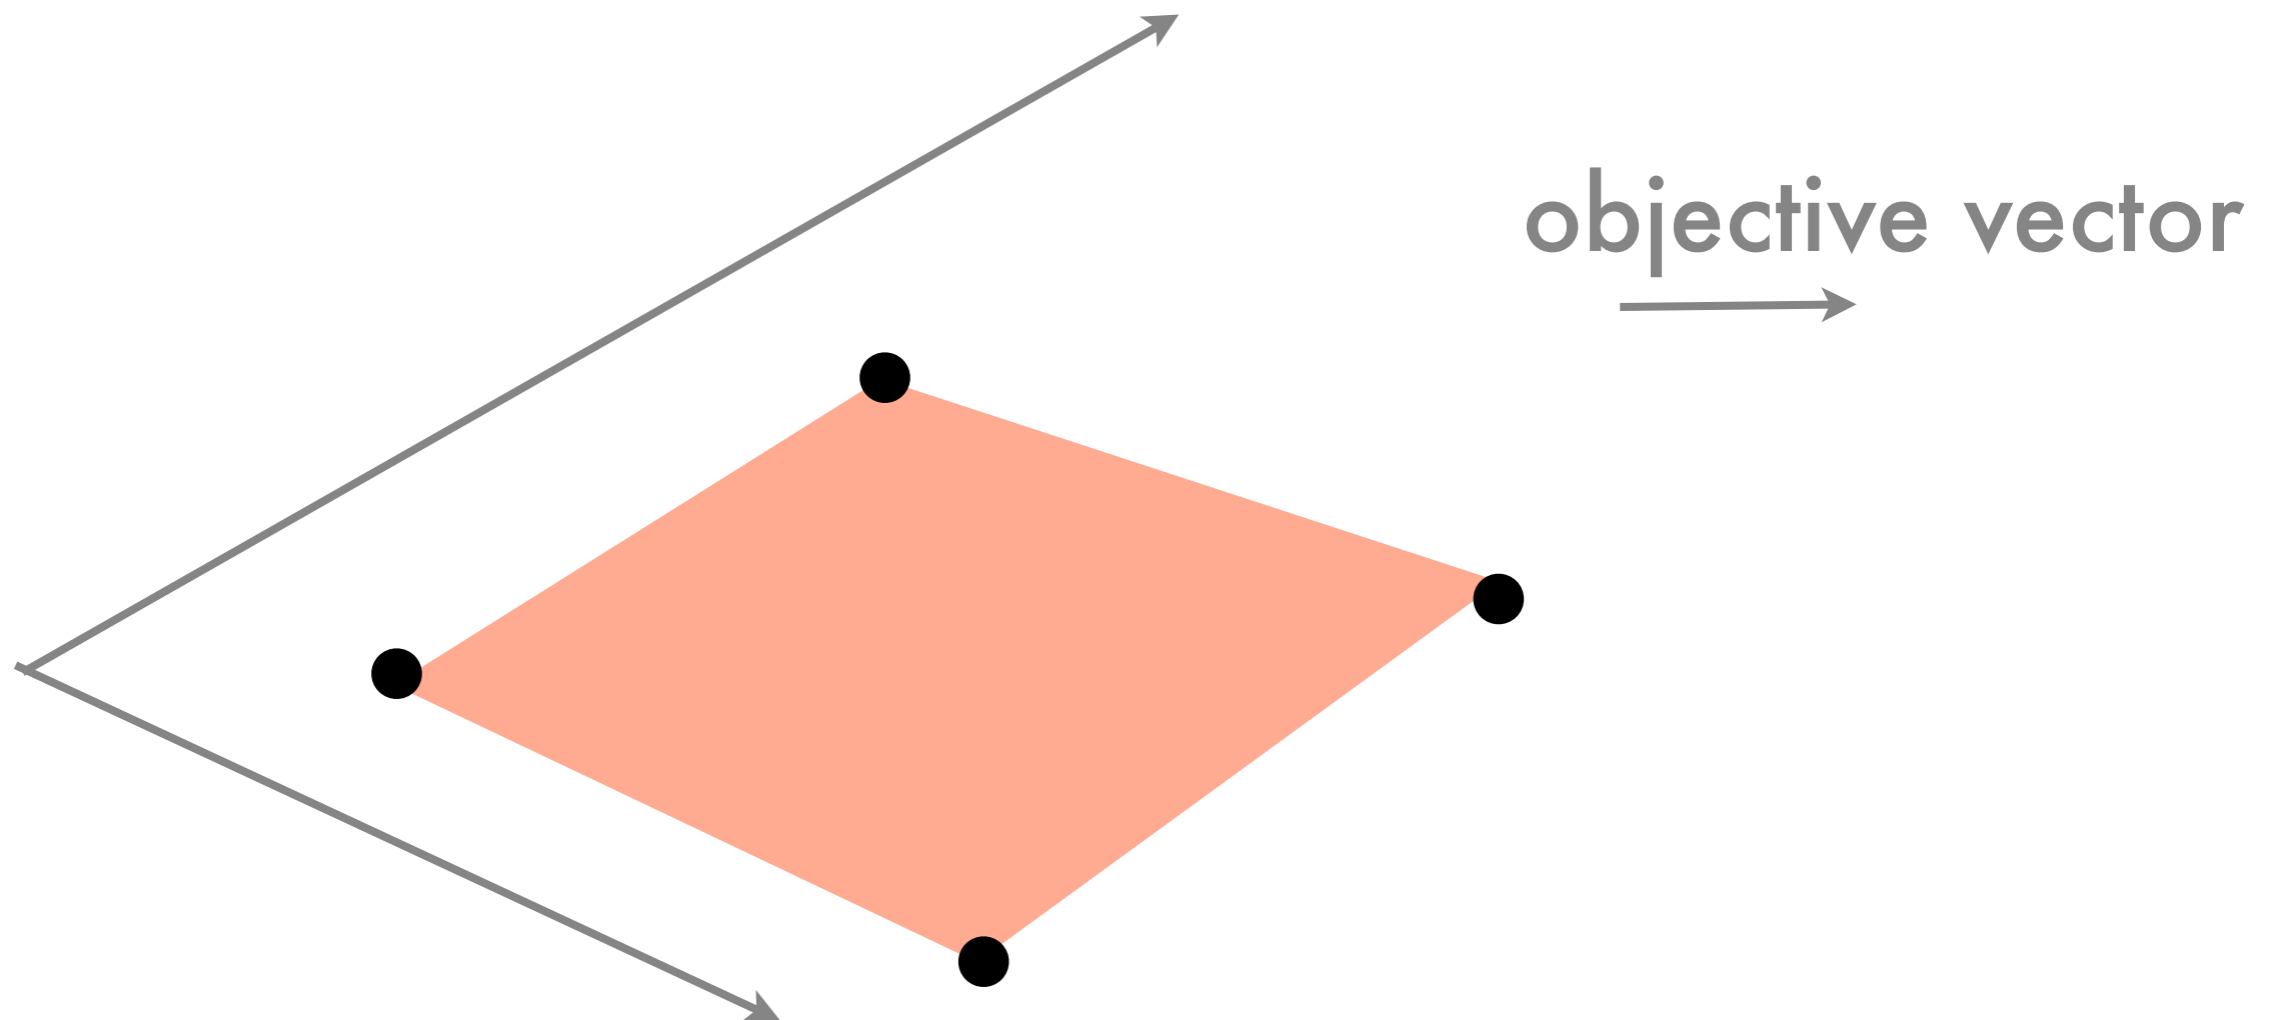

# Our contribution

- We project the search space on a lower dimensional space

# Our contribution

- The result is a LP which is totally unimodular and corresponds to a shortest path problem

# Our new linear program

$X_{jt}$

# Our new linear program

- Sum constraints on  $X_{jt}$  to get constraints on  $Y_t$

- $\forall j \forall t \quad 0 \leq X_{jt} \leq 1$   
 $\forall j \forall t \notin [r_j, d_j) \quad X_{jt} = 0$   
 $\forall j \quad \sum_t X_{jt} = 1$   
 $\forall t \quad \sum_j s_j X_{jt} \leq 3$

# Our new linear program

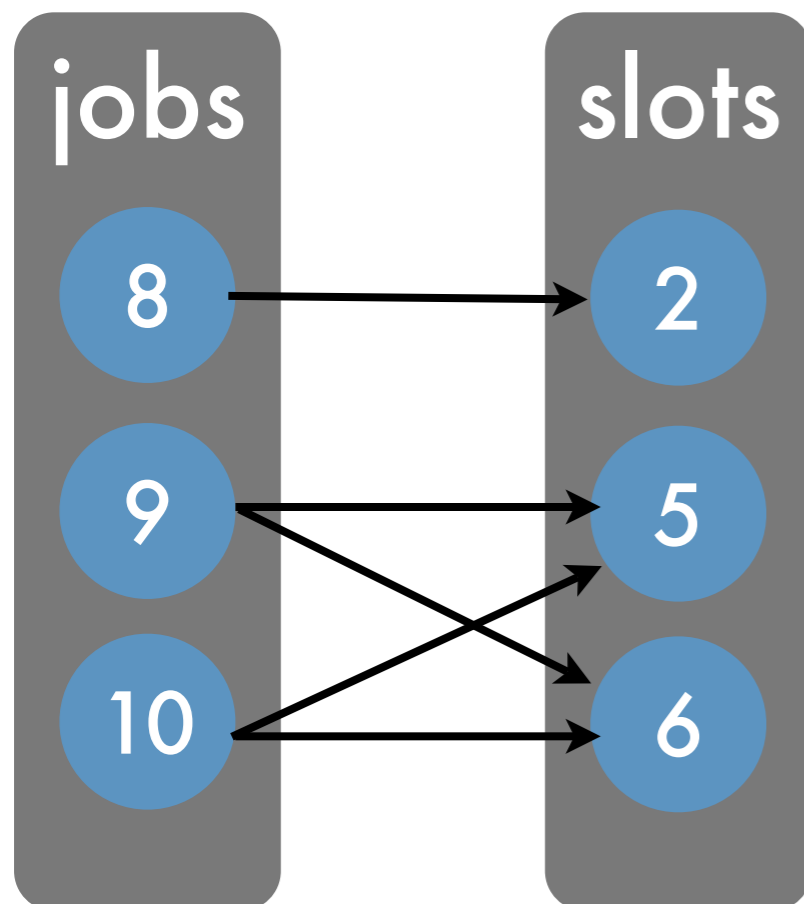

- Sum constraints on  $X_{jt}$  to get constraints on  $Y_t$

- $\forall j \forall t \quad 0 \leq X_{jt} \leq 1$   
 $\forall j \forall t \notin [r_j, d_j) \quad X_{jt} = 0$   
 $\forall j \quad \sum_t X_{jt} = 1$   
 $\forall t \quad \sum_j s_j X_{jt} \leq 3$

- $\forall t \quad 0 \leq Y_t \leq 1$   
 $\forall s, u \quad \sum_{t \in [s, u)} Y_t \geq A_{su}$   
 $\forall s, u \quad u - s - \sum_{t \in [s, u)} Y_t \geq \lceil B_{su} / 3 \rceil$
- where  
 $A_{su} := |\{j: s_j = 3 \wedge [r_j, d_j] \subseteq [s, u]\}|$   
 $B_{su} := |\{j: s_j = 1 \wedge [r_j, d_j] \subseteq [s, u]\}|$

# The ILP solves the problem

- By Hall's theorem we can assign jobs to slots
- Simply EDD assign large jobs, then small jobs in remaining slots

- $\forall t \quad 0 \leq Y_t \leq 1$   
 $\forall s, u \quad \sum_{t \in [s, u)} Y_t \geq A_{su}$   
 $\forall s, u \quad u - s - \sum_{t \in [s, u)} Y_t \geq \lceil B_{su} / 3 \rceil$
- where  
 $A_{su} := |\{j: s_j = 3 \wedge [r_j, d_j] \subseteq [s, u]\}|$   
 $B_{su} := |\{j: s_j = 1 \wedge [r_j, d_j] \subseteq [s, u]\}|$

# The LP is totally unimodular

- additional transformation:  $Z_t = Y_t + \dots + Y_{n-1}$ ,  $Z_n = 0$
- the LP is a shortest path problem

- $\forall t \quad 0 \leq Y_t \leq 1$
- $\forall s, u \quad \sum_{t \in [s, u)} Y_t \geq A_{su}$
- $\forall s, u \quad u - s - \sum_{t \in [s, u)} Y_t \geq \lceil B_{su} / 3 \rceil$

- $\forall t \quad 0 \leq Z_t - Z_{t+1} \leq 1$
- $\forall s, u \quad Z_s - Z_u \geq A_{su}$
- $\forall s, u \quad Z_s - Z_u \geq \lceil B_{su} / 3 \rceil$

# Where our method worked

- $3 \mid r_i, \text{size}_i \in \{1, 3\}, p_i = 1 \mid L_{\max}$   
 [Baptiste, Schieber'05] LP( $n^2$  var.)  
 [D, Hurand'06] comb. alg. in  $O(n^3)$ .
- *Offline caching with prefetching*  
 [Albers, Garg, Leonardi'00] LP( $n^2F$  var.)  
 [D, Hurand'06] comb. alg. in  $O(n^3)$ .

|                        |   |   |     |   |     |   |     |   |   |   |

# Where our method failed

- $P \mid r_i, p_i=p, D_i \mid \sum w_i C_i$   
[Brucker, Kravchenko'05] LP( $n^3$  var.)

# LP which we suspect to have always an integral optima

- $1 \mid r_i, p_i=p, p \text{ mtn} \mid \sum w_i C_i$   
☹ Baptiste, Chrobak, Hurand, Sgall, ...
- we know that there are always integral optima when  $p > \max r_i$
- we don't know even for  $r_i=i, p=2$
